

WE ARE HIRING: BACK-END DEVELOPER

Department	Technology & Product
Role	Back-End Developer
Location	Remote
Employment	Full-Time · Flexible Work Structure
Stack	TypeScript · Node.js or NestJS · PostgreSQL
Application	CV + Cover Letter + GitHub/Portfolio

BUILD SECURE SYSTEMS BEHIND HIGH-IMPACT PRODUCTS

AfriVate Technologies Ltd is looking for a Back-End Developer to design reliable APIs, data models, integrations, and services that work naturally with modern React applications. Our recommended foundation is **TypeScript, Node.js using Express or Fastify, or NestJS, with PostgreSQL**. This gives the product team a shared language across frontend and backend while retaining a strong relational data foundation.

WHAT YOU WILL DO

- Design, build, document, and maintain secure REST APIs and backend services.
- Model relational data in PostgreSQL and write safe migrations, queries, indexes, and constraints.
- Implement authentication, role-based access control, permissions, validation, audit trails, and secure file workflows.
- Integrate backend services cleanly with React clients and third-party providers.
- Build background jobs, notifications, webhooks, scheduled processes, and real-time workflows where required.
- Write automated tests, review pull requests, monitor failures, and diagnose production issues.
- Use Git and GitHub for collaborative delivery, keep work current in the AfriVate Portal, and communicate through Slack.

CORE REQUIREMENTS

- Strong JavaScript/TypeScript and practical backend experience with **Node.js**.
- Experience building APIs with **Node.js using Express or Fastify, NestJS**, or a comparable framework.

- Strong understanding of **PostgreSQL**, relational modelling, transactions, migrations, indexing, and query performance.
- Understanding of authentication, authorisation, input validation, API security, and OWASP fundamentals.
- Comfort with Git/GitHub, pull requests, code review, debugging, and technical documentation.
- Ability to design clear API contracts that frontend developers can consume reliably.

PREFERRED STACK & NICE-TO-HAVE EXPERIENCE

- **Node.js with Express or Fastify, or NestJS** for TypeScript backend services, with **PostgreSQL** as the primary database;
- Prisma, Drizzle, or TypeORM where an ORM improves maintainability;
- Redis, caching, queues, background workers, webhooks, and scheduled jobs;
- Jest/Vitest, integration testing, contract testing, and API documentation with OpenAPI/Swagger;
- Docker, Linux, CI/CD, cloud/serverless deployment, logging, monitoring, and incident response;
- Optional experience with Supabase, Firebase, Appwrite, or another backend-as-a-service platform;
- Experience supporting React or React Native clients.

WHAT WE VALUE

- Security-minded engineering and careful handling of user data;
- Clear ownership, accurate estimates, and early escalation of blockers;
- Simple, maintainable architecture over unnecessary complexity;
- Evidence-based problem-solving, documentation, and respectful collaboration.

ROLE BENEFITS

- **Remote, flexible work:** A full-time role with a flexible work structure focused on accountability and outcomes.
- **Equity participation:** A 2% equity stake vesting over two years, subject to the formal equity award, vesting terms, continued service, and applicable company documentation.
- **Monthly data support:** A ₦20,000 data stipend to support reliable remote work.
- **Professional growth:** Practical learning opportunities, direct exposure to product, architecture, infrastructure, and security decisions, and space to strengthen your technical judgement.
- **Meaningful ownership:** The opportunity to shape backend systems, engineering standards, and technical foundations from an early stage.

- **Career development:** Clear responsibility, portfolio-strengthening work, cross-functional collaboration, and increased leadership opportunities as the company grows.
- **Purpose-led impact:** Work on technology intended to improve connectivity and elevate life across Africa.

HOW TO APPLY

Email the following application materials to **afrivatehr@gmail.com**:

- Your current CV;
- A tailored cover letter explaining why you want to join AfriVate and how your experience fits this role;
- Your GitHub profile; and
- Relevant repositories, deployed APIs, or a technical portfolio.

Required email subject: APPLICATION FOR BACK-END DEVELOPER — [YOUR FULL NAME]

Technical note: Identify a backend system or API you built and briefly explain its architecture, your contribution, security decisions, and one challenge you resolved.

Applications sent without the required subject line or cover letter may not be reviewed.
